MATHEMATICAL MODELING OF DYNAMICS OF POPULATION DEVELOPMENT

V.G. Malenko

Institute for Applied System Analysis, Ukraine

The problem of population dynamics is central to ecological studies. For a more adequate description of population dynamics one must take into consideration heterogeneity of individuals' properties, particularly the age-old structure.

A simpler example of a structured model for age is a von Foerster's linear model [1]. It looks like this:

$$\frac{\partial \tilde{\varphi}}{\partial t} = r \left[\frac{g}{\omega} \nabla \tilde{Q} - 2\tilde{U} \cdot \nabla \tilde{\varphi} - \gamma_d \tilde{\varphi} \right], \quad (1)$$

Requirements for arrangement of articles for publication in the journal "Mathematical Machines and Systems" are presented here: <http://www.immsp.kiev.ua/publications/rules.html> and in the Journal of CNUT <http://tst.stu.cn.ua/?task=page&l=ua&id=1>
